

class12

Mary Tatarian

1. Bioconductor and DESeq2 setup

```
#install.packages("BiocManager")  
#BiocManager::install()  
#BiocManager::install("DESeq2")  
library(BiocManager)
```

Bioconductor version '3.16' is out-of-date; the current release version '3.17' is available with R version '4.3'; see <https://bioconductor.org/install>

```
library(DESeq2)
```

Loading required package: S4Vectors

Loading required package: stats4

Loading required package: BiocGenerics

Attaching package: 'BiocGenerics'

The following objects are masked from 'package:stats':

IQR, mad, sd, var, xtabs

The following objects are masked from 'package:base':

```
anyDuplicated, aperm, append, as.data.frame, basename, cbind,  
colnames, dirname, do.call, duplicated, eval, evalq, Filter, Find,  
get, grep, grepl, intersect, is.unsorted, lapply, Map, mapply,  
match, mget, order, paste, pmax, pmax.int, pmin, pmin.int,  
Position, rank, rbind, Reduce, rownames, sapply, setdiff, sort,  
table, tapply, union, unique, unsplit, which.max, which.min
```

Attaching package: 'S4Vectors'

The following objects are masked from 'package:base':

```
expand.grid, I, unname
```

Loading required package: IRanges

Loading required package: GenomicRanges

Loading required package: GenomeInfoDb

Loading required package: SummarizedExperiment

Loading required package: MatrixGenerics

Loading required package: matrixStats

Attaching package: 'MatrixGenerics'

The following objects are masked from 'package:matrixStats':

```
colAlls, colAnyNAs, colAnys, colAvgPerRowSet, colCollapse,  
colCounts, colCummaxs, colCummins, colCumprods, colCumsums,

rowWeightedMads, rowWeightedMeans, rowWeightedMedians,  
rowWeightedSds, rowWeightedVars
```

Loading required package: Biobase

Welcome to Bioconductor

```
Vignettes contain introductory material; view with  
'browseVignettes()'. To cite Bioconductor, see  
'citation("Biobase")', and for packages 'citation("pkgname")'.
```

Attaching package: 'Biobase'

The following object is masked from 'package:MatrixGenerics':

```
rowMedians
```

The following objects are masked from 'package:matrixStats':

```
anyMissing, rowMedians
```

2. Import countData and colData

```
counts <- read.csv("airway_scaledcounts.csv", row.names=1)  
metadata <- read.csv("airway_metadata.csv")  
  
head(counts)
```

	SRR1039508	SRR1039509	SRR1039512	SRR1039513	SRR1039516

ENSG000000000460	94	102	74
ENSG000000000938	0	0	0

```
head(metadata)
```

	id	dex	celltype	geo_id
1	SRR1039508	control	N61311	GSM1275862
2	SRR1039509	treated	N61311	GSM1275863
3	SRR1039512	control	N052611	GSM1275866
4	SRR1039513	treated	N052611	GSM1275867
5	SRR1039516	control	N080611	GSM1275870
6	SRR1039517	treated	N080611	GSM1275871

Q1. How many genes are in this dataset?

```
nrow(counts)
```

```
[1] 38694
```

Q2. How many 'control' cell lines do we have?

```
control_cell_lines <- table(metadata$dex)['control']
control_cell_lines
```

```
control
4
```

3. Toy differential gene expression

Q3. How would you make the above code in either approach more robust?

- see below

```
control <- metadata[metadata[, "dex"]=="control",]  
control.counts <- counts[ ,control$id]  
control.mean <- rowMeans( control.counts )  
head(control.mean)
```

```
ENSG000000000003 ENSG000000000005 ENSG000000000419 ENSG000000000457 ENSG000000000460  
          900.75          0.00          520.50          339.75          97.25  
ENSG0000000000938  
          0.75
```

Q4. Follow the same procedure for the **treated** samples (i.e. calculate the mean per gene across drug treated samples and assign to a labeled vector called **treated.mean**)

```
treated <- metadata[metadata[, "dex"]=="treated",]  
treated.mean <- rowSums( counts[ ,treated$id] )/4  
  
meancounts <- data.frame(control.mean, treated.mean)  
colSums(meancounts)
```

```
control.mean treated.mean  
    23005324    22196524
```

Q5 (a). Create a scatter plot showing the mean of the treated samples against the mean of the control samples. Your plot should look something like the following.

```
plot(meancounts[,1],meancounts[,2], xlab="Control", ylab="Treated")
```

Q5 (b). You could also use the **ggplot2** package to make this figure producing the plot below. What **geom_?()** function would you use for this plot?

- use `geom_point`

```
library(ggplot2)
ggplot()+
  aes(control.mean, treated.mean)+
  geom_point()
```

Q6. Try plotting both axes on a log scale. What is the argument to **plot()** that allows you to do this?

- log

```
plot(log(control.mean),log(treated.mean), xlab="log Control", ylab="log Mean")
```

```
log2(5/20)
```

```
[1] -2
```

to calculate the log2 of the fold change between treated and control

```
meancounts$log2fc <- log2(meancounts$treated.mean/  
                           meancounts$control.mean)
```

Q7. What is the purpose of the `arr.ind` argument in the `which()` function call above? Why would we then take the first column of the output and need to call the `unique()` function?

- The `arr.ind=TRUE` argument will cause `which()` to return both the row and column indices (i.e. positions) where there are TRUE values. In this case this will tell us which genes (rows) and samples (columns) have zero counts. Calling `unique()` will ensure we don't count any row twice if it has zero entries in both samples. Ask Marcos to discuss and demo this further

removing 0 values

```

zero.vals <- which(meancounts[,1:2]==0, arr.ind=TRUE)

to.rm <- unique(zero.vals[,1])
mycounts <- meancounts[-to.rm,]
head(mycounts)

```

	control.mean	treated.mean	log2fc
ENSG000000000003	900.75	658.00	-0.45303916
ENSG000000000419	520.50	546.00	0.06900279
ENSG000000000457	339.75	316.50	-0.10226805
ENSG000000000460	97.25	78.75	-0.30441833
ENSG000000000971	5219.00	6687.50	0.35769358
ENSG000000001036	2327.00	1785.75	-0.38194109

overexpressed and underexpressed genes

Q8. Using the `up.ind` vector above can you determine how many up regulated genes we have at the greater than 2 fc level?

- 250

```

up.ind <- mycounts$log2fc > 2
table(up.ind)

```

```

up.ind
FALSE TRUE
21567  250

```

Q9. Using the `down.ind` vector above can you determine how many down regulated genes we have at the greater than 2 fc level?

- 367

```

down.ind <- mycounts$log2fc < (-2)
table (down.ind)

```

```

down.ind
FALSE TRUE
21450  367

```

Q10. Do you trust these results? Why or why not?

we did all of our analysis based on fold change, but fold change can be large without being statistically significant, which is determined based on p-value. we also havent performed any tests to see if the differences are significant. These results in the current form are likely to be very misleading.

4. DESeq2 analysis

```
library(DESeq2)
citation("DESeq2")
```

To cite package 'DESeq2' in publications use:

Love, M.I., Huber, W., Anders, S. Moderated estimation of fold change and dispersion for RNA-seq data with DESeq2 Genome Biology 15(12):550 (2014)

A BibTeX entry for LaTeX users is

summary of res

```
summary(res)
```

out of 25258 with nonzero total read count

adjusted p-value < 0.1

LFC > 0 (up) : 1563, 6.2%

LFC < 0 (down) : 1188, 4.7%

outliers [1] : 142, 0.56%

low counts [2] : 9971, 39%

(mean count < 10)

- [1] see 'cooksCutoff' argument of ?results
- [2] see 'independentFiltering' argument of ?results

The results function contains a number of arguments to customize the results table. By default the argument `alpha` is set to 0.1. If the adjusted p value cutoff will be a value other than 0.1, `alpha` should be set to that value:

```
res05 <- results(dds, alpha=0.05)
summary(res05)
```

```
out of 25258 with nonzero total read count
adjusted p-value < 0.05
LFC > 0 (up)      : 1236, 4.9%
LFC < 0 (down)    : 933, 3.7%
outliers [1]     : 142, 0.56%
low counts [2]   : 9033, 36%
(mean count < 6)
[1] see 'cooksCutoff' argument of ?results
[2] see 'independentFiltering' argument of ?results
```

6. Data Visualization

```
plot(res$log2FoldChange, -log10(res$padj), ylab="-Log(P-value)", xlab="Log2(FoldChange)")
abline(v=c(-2,2), col="darkgray", lty=2)
abline(h=-log(0.05), col="darkgray", lty=2)
```

```
mycols <- rep("gray", nrow(res))
mycols[ abs(res$log2FoldChange) > 2 ] <- "red"

inds <- (res$padj < 0.01) & (abs(res$log2FoldChange) > 2 )
mycols[ inds ] <- "blue"

# Volcano plot with custom colors
plot( res$log2FoldChange, -log(res$padj),
      col=mycols, ylab="-Log(P-value)", xlab="Log2(FoldChange)" )

# Cut-off lines
abline(v=c(-2,2), col="gray", lty=2)
abline(h=-log(0.1), col="gray", lty=2)
```
